

Nashville Dogs

Lacrosse Club

AthleteAI (OFFDAYS) Dashboard Screenshots

A stakeholder walkthrough of the three dashboards that Directors, Coaches, and Athletes see.

Real captures from the running application, seeded with a sample Nashville Dogs roster:
2031 Red team - 13 athletes, 3 coaches, 1 director.

What is OFFDAYS / AthleteAI?

OFFDAYS (pronounced 'off-days') is an on-device training companion for youth athletes.

The athlete records a workout on their phone - wall ball, push-ups, squats, high-knees, squat jumps - and the phone's camera analyzes each rep in real time using pose detection that runs entirely on the device. No video leaves the phone.

Only derived counts are uploaded to the server:

- rep count | which hand | timing | confidence | range of motion

Three dashboards, three roles:

- Director sees the whole program across all teams.
- Coach sees only their assigned team.
- Athlete sees their own home - current assignment, weekly plan, film clips.

Figure 1: Director Dashboard
Joel White - whole-program overview for Nashville Dogs

The director sees every athlete on every team. Key panels: total program XP, nudge list (athletes who haven't logged in recently), automatic recognition milestones, active assignments across all teams, and the film-shelf coverage showing which clips the whole club has watched.

Figure 2: Coach Dashboard
Coach Tommy - team view for 2031 Red

A coach sees only their assigned team. The panel shows per-athlete form scores (consistency, depth, tempo, endurance), streak counts, weekly volume, weak-hand vs strong-hand balance, and athletes who need a nudge. The film shelf shows which Lacrosse IQ clips have been assigned and who has watched them.

Figure 3: Athlete Dashboard
Ryder Kallberg - 2031 Red, attack position

The athlete sees their current assignment (wall ball with live rep progress and off-hand balance), their weekly plan for off-days broken down by day of the week, and the film clips with quiz questions. The plan's daily line reflects the athlete's age: this 13-year-old gets a concrete, achievable target without overload language.

Weekly Off-Day Plan - How It Works

On days with no team obligation, the athlete gets a short, concrete plan: which drill to do, how many reps, and a suggested time box.

The plan respects age so it never burns out a young player and never under-loads an older one.

UNDER 11 (U8-U10):

Short, encouraging lines. 'Today's plan: wall ball, keep your stick busy.'
No target demand. Soft nudge: 'If you have 10 minutes, wall ball is a great way to spend them.' Never tells a young player they're behind.

AGES 12-15 (U11-U15):

Concrete 'enough' framing. 'Three sessions this week is right where you want to be.' Soft cap on volume - the plan says when enough has been done, not to push past it. Recognizes the athlete's existing practice load.

AGES 16+ / ADULT:

Honest volume framing - names how many sessions and roughly how many minutes the plan expects, with the weekly cap visible so the athlete can see when they've hit it. Treats the athlete as a serious trainee.

The seed data in this bundle uses a 2031 birth-year squad (mostly 13-year-olds).
The plan lines in the athlete screenshot reflect that age band: specific enough to be motivating, light enough to fit around school and team practice.

Film Study - Lacrosse IQ

Short video clips (typically 60-110 seconds) teach sport-specific IQ:

- Sliding from the crease
- Man-down rotations
- Clearing under pressure
- Riding as a unit
- Off-ball cutting

Each clip has a focus line a coach would recognize, and most have a one-question quiz where a wrong answer comes with a short explanation of why the right answer matters.

The coach sees coverage - who has watched what - so film study becomes visible in the same way off-day training is. This turns 'watch film' from a vague instruction into something trackable on the dashboard.

How Coaches Use This During Practice

The dashboard exists so that during practice, coaches are not spending a whole bunch of time on fundamentals.

If the dashboard shows that a player has been reliably hitting their off-day wall-ball target, the coach knows the player's repetition base is there and can spend practice time on team concepts and game situations.

If a player's form score is slipping or their weak-hand balance is lopsided, the coach sees that before practice starts and can address it in the warm-up rather than discovering it mid-drill.

ABOUT THIS BUNDLE:

These screenshots were generated from the live OFFDAYS application (github.com/mkallberg21/AthleteAI) seeded with a sample Nashville Dogs roster: the 2031 Red team, 13 athletes, three coaches, one director, six weeks of training history, one active wall-ball assignment, and five Lacrosse IQ film clips.

The application runs on the athlete's phone (on-device pose analysis, no video upload) and on a lightweight server that stores derived training counts, form scores, streaks, leaderboards, assignments, and film-study progress.

For questions, feature requests, or to set up a program:
